

Circular current loop as a magnetic dipole

- When a **current passes through a circular loop** it is **considered a magnetic dipole**.

Circular current loop as a magnetic dipole

- When a **current passes through a circular loop** it is **considered a magnetic dipole**.
- The **magnetic dipole moment $\vec{m}$** of a current loop is **defined as the product of the current (**I**) in the loop and area of the loop (**A**)**.

Circular current loop as a magnetic dipole

- When a **current passes through a circular loop** it is **considered a magnetic dipole**.
- The **magnetic dipole moment $\vec{m}$** of a current loop is **defined as the product of the current (I) in the loop and area of the loop (A)**.

$$\vec{m} = N I \vec{A}$$

Here, **N** is the **no. of turns** in the loop

Circular current loop as a magnetic dipole

- When a **current passes through a circular loop** it is **considered a magnetic dipole**.
- The **magnetic dipole moment $\vec{m}$** of a current loop is **defined as the product of the current (I) in the loop and area of the loop (A)**.

$$\vec{m} = N I \vec{A}$$

Here, **N** is the **no. of turns** in the loop

- The **direction of magnetic dipole** is **determine** according to **right hand thumb rule**.

Circular current loop as a magnetic dipole

- **Magnetic field on the axis of a circular current loop of radius R and carrying steady current (I) is**

Circular current loop as a magnetic dipole

- **Magnetic field on the axis of a circular current loop of radius R and carrying steady current (I) is**

$$B = \frac{\mu_o I R^2}{2(x^2 + R^2)^{3/2}}$$

Circular current loop as a magnetic dipole

- **Magnetic field on the axis of a circular current loop of radius R and carrying steady current (I) is**

$$B = \frac{\mu_o I R^2}{2(x^2 + R^2)^{3/2}}$$

for $x \gg R$, ($x^2 + R^2 \approx x^2$)

Circular current loop as a magnetic dipole

- **Magnetic field on the axis of a circular current loop of radius R and carrying steady current (I) is**

$$B = \frac{\mu_o I R^2}{2(x^2 + R^2)^{3/2}}$$

for $x \gg R$, ($x^2 + R^2 \approx x^2$)

$$B = \frac{\mu_o I R^2}{2x^3}$$

Circular current loop as a magnetic dipole

Figure 12.11 Determining the magnetic field at point P along the axis of a current-carrying loop of wire.

- **Magnetic field on the axis of a circular current loop of radius R and carrying steady current (I) is**

$$B = \frac{\mu_o I R^2}{2(x^2 + R^2)^{3/2}}$$

for $x \gg R$, ($x^2 + R^2 \approx x^2$)

$$B = \frac{\mu_o I R^2}{2x^3}$$

$$B = \frac{\mu_o I R^2}{2\pi x^3} \frac{2\pi}{2\pi} = \frac{2\mu_o I A}{4\pi x^3} (\because A = \pi R^2)$$

Circular current loop as a magnetic dipole

Figure 12.11 Determining the magnetic field at point P along the axis of a current-carrying loop of wire.

- **Magnetic field on the axis of a circular current loop of radius R and carrying steady current (I) is**

$$B = \frac{\mu_o I R^2}{2(x^2 + R^2)^{3/2}}$$

for $x \gg R$, $(x^2 + R^2 \approx x^2)$

$$B = \frac{\mu_o I R^2}{2x^3}$$

$$B = \frac{\mu_o I R^2}{2\pi x^3} \frac{2\pi}{2\pi} = \frac{2\mu_o I A}{4\pi x^3} (\because A = \pi R^2)$$

$$B = \frac{\mu_o 2m}{4\pi x^3} (\because m = IA)$$

Circular current loop as a magnetic dipole

- This above expression is similar to electric field due to an electric dipole on its axis.

Circular current loop as a magnetic dipole

- This above expression is similar to electric field due to an electric dipole on its axis.

$$E = \frac{2p}{4\pi\epsilon_0 x^3}$$

Circular current loop as a magnetic dipole

- This above expression is similar to electric field due to an electric dipole on its axis.

$$E = \frac{2p}{4\pi\epsilon_0 x^3}$$

- Similarly, Electric field on the perpendicular bisector of the electric dipole is give by.

Circular current loop as a magnetic dipole

- This above expression is similar to electric field due to an electric dipole on its axis.

$$E = \frac{2p}{4\pi\epsilon_0 x^3}$$

- Similarly, Electric field on the perpendicular bisector of the electric dipole is give by.

$$E = \frac{1}{4\pi\epsilon_0} \frac{p}{x^3}$$

Circular current loop as a magnetic dipole

- **If we replace p by m , $\frac{1}{\epsilon_o}$ by μ_o and E by B , We obtain the result for magnetic field B for point on the plane of the current loop.**

Circular current loop as a magnetic dipole

- If we replace p by m , $\frac{1}{\epsilon_o}$ by μ_o and E by B , We obtain the result for magnetic field B for point on the plane of the current loop.

$$B = \frac{\mu_o}{4\pi} \frac{m}{x^3}$$

Torque on a Current Loop In a Uniform Magnetic Field

- A rectangular loop carrying a steady current I and placed in a uniform magnetic field experiences a torque. It does not experience a net force.

Torque on a Current Loop In a Uniform Magnetic Field

- A rectangular loop carrying a steady current I and placed in a uniform magnetic field experiences a torque. It does not experience a net force.
- This behaviour is analogous to that of electric dipole in a uniform electric field.

(1) When uniform magnetic field B is in the plane of the loop

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- The field exerts **no force** on the two **arms AD and BC** of the loop ($\because I$ and $\mathbf{B}$ are in the same direction).

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- The field exerts **no force** on the two **arms AD and BC** of the loop ($\because I$ and $\mathbf{B}$ are in the same direction).
- The force F_1 on side AB is

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- The field exerts **no force** on the two **arms AD and BC** of the loop ($\because I$ and $\mathbf{B}$ are in the same direction).

- The force F_1 on side AB is

$$\boxed{F_1 = IbB} \text{ (into the plane of loop)}$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field B is in the plane of the loop

- The field exerts **no force** on the two **arms AD and BC** of the loop ($\because I$ and B are in the same direction).
- The force F_1 on side AB is

$$F_1 = IbB$$
 (into the plane of loop)
- Similarly, force F_2 on the arm CD

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- The field exerts **no force** on the two **arms AD and BC** of the loop ($\because I$ and $\mathbf{B}$ are in the same direction).

- The force F_1 on side AB is

$$\boxed{F_1 = IbB} \text{ (into the plane of loop)}$$

- Similarly, force F_2 on the arm CD

$$\boxed{F_2 = IbB} \text{ (out of the plane of loop)}$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- The field exerts **no force** on the two **arms AD and BC** of the loop ($\because I$ and $\mathbf{B}$ are in the same direction).
- The force F_1 on side AB is
$$\boxed{F_1 = IbB}$$
(into the plane of loop)
- Similarly, force F_2 on the arm CD
$$\boxed{F_2 = IbB}$$
(out of the plane of loop)
- Thus, the **net force on the loop is zero**.

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- There is a **torque on the loop** due to the pair of **forces $\mathbf{F}_1$ and $\mathbf{F}_2$** .

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- There is a **torque on the loop** due to the pair of **forces $\mathbf{F}_1$ and $\mathbf{F}_2$** .
- Magnitude of this torque is

$$\tau = F_1 \frac{a}{2} + F_2 \frac{a}{2}$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- There is a **torque on the loop** due to the pair of **forces $\mathbf{F}_1$ and $\mathbf{F}_2$** .
- Magnitude of this torque is

$$\tau = F_1 \frac{a}{2} + F_2 \frac{a}{2}$$
$$\tau = IbB \frac{a}{2} + IbB \frac{a}{2} = IabB$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 1: When uniform magnetic field $\mathbf{B}$ is in the plane of the loop

- There is a **torque on the loop** due to the pair of **forces $\mathbf{F}_1$ and $\mathbf{F}_2$** .
- Magnitude of this torque is

$$\tau = F_1 \frac{a}{2} + F_2 \frac{a}{2}$$

$$\tau = IbB \frac{a}{2} + IbB \frac{a}{2} = IabB$$

$$\boxed{\tau = IAB} \text{ (Here, } A = ab \text{ is the area of the loop)}$$

(2) When the plane of the loop, is not along the magnetic field

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- Let the **angle between the field and the normal** to the coil to be angle θ

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- Let the **angle between the field and the normal** to the coil to be angle θ
- The **forces on the arms BC and DA are equal, opposite, and act along the axis** of the coil. Being **collinear** along the axis they cancel each other, **resulting in no net force or torque.**

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The forces on arms **AB** and **CD** are F_1 and F_2 . They too are **equal and opposite**, with magnitude,

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The forces on arms **AB** and **CD** are F_1 and F_2 . They too are **equal and opposite**, with magnitude,

$$F_1 = F_2 = I b B$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The forces on arms **AB** and **CD** are F_1 and F_2 . They too are **equal and opposite**, with magnitude,

$$F_1 = F_2 = I b B$$

- But they are **not collinear**! This **results in a couple** as before. The torque on the loop is,

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The forces on arms **AB** and **CD** are F_1 and F_2 . They too are **equal and opposite**, with magnitude,

$$F_1 = F_2 = I b B$$

- But they are **not collinear**! This **results in a couple** as before. The torque on the loop is,

$$\tau = F_1 \frac{a}{2} \sin \theta + F_2 \frac{a}{2} \sin \theta$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The forces on arms **AB** and **CD** are F_1 and F_2 . They too are **equal and opposite**, with magnitude,

$$F_1 = F_2 = I b B$$

- But they are **not collinear**! This **results in a couple** as before. The torque on the loop is,

$$\tau = F_1 \frac{a}{2} \sin \theta + F_2 \frac{a}{2} \sin \theta$$

$$\tau = \frac{a \sin \theta}{2} (F_1 + F_2)$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

$$\tau = \frac{a \sin \theta}{2} (2IbB) = IabB \sin \theta$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

$$\tau = \frac{a \sin \theta}{2} (2IbB) = IabB \sin \theta$$

$$\tau = IAB \sin \theta \quad (\text{Here, } A \text{ is the area of the loop})$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

$$\tau = \frac{a \sin \theta}{2} (2IbB) = IabB \sin \theta$$

$$\tau = IAB \sin \theta \quad (\text{Here, } A \text{ is the area of the loop})$$

- Now, we **define** a quantity **magnetic moment** ($\vec{m}$) of the current loop as,

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

$$\tau = \frac{a \sin \theta}{2} (2IbB) = IabB \sin \theta$$

$$\tau = IAB \sin \theta \quad (\text{Here, } A \text{ is the area of the loop})$$

- Now, we **define** a quantity **magnetic moment** ($\vec{m}$) of the current loop as,

$$\vec{m} = I\vec{A}$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

$$\tau = \frac{a \sin \theta}{2} (2IbB) = IabB \sin \theta$$

$$\tau = IAB \sin \theta \quad (\text{Here, } A \text{ is the area of the loop})$$

- Now, we **define** a quantity **magnetic moment** ($\vec{m}$) of the current loop as,

$$\vec{m} = I\vec{A}$$

- The **direction** of the **area vector** $\vec{A}$ is **given** by the **right-hand thumb rule**.

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- This **torque** ($\vec{\tau}$) can be **expressed** as **vector product** of the **magnetic moment** ($\vec{m}$) of the coil **and** the **magnetic field** ($\vec{B}$)

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- This **torque** ($\vec{\tau}$) can be **expressed** as **vector product** of the **magnetic moment** ($\vec{m}$) of the coil **and** the **magnetic field** ($\vec{B}$)

$$\vec{\tau} = \vec{m} \times \vec{B}$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- This **torque** ($\vec{\tau}$) can be **expressed** as **vector product** of the **magnetic moment** ($\vec{m}$) of the coil and the **magnetic field** ($\vec{B}$)

$$\vec{\tau} = \vec{m} \times \vec{B}$$

- This is analogous to the **Electric dipole** of **dipole moment** $\vec{p}$ in an **electric field** $\vec{E}$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- This **torque** ($\vec{\tau}$) can be **expressed** as **vector product** of the **magnetic moment** ($\vec{m}$) of the coil and the **magnetic field** ($\vec{B}$)

$$\vec{\tau} = \vec{m} \times \vec{B}$$

- This is **analogous** to the **Electric dipole** of **dipole moment** $\vec{p}$ in an **electric field** $\vec{E}$

$$\vec{\tau} = \vec{p} \times \vec{E}$$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The **torque** ($\vec{\tau}=0$) **vanishes** when $\vec{m}$ is either **parallel or antiparallel** to the **magnetic field** $\vec{B}$

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The **torque** ($\vec{\tau}=0$) **vanishes** when $\vec{m}$ is either **parallel or antiparallel** to the **magnetic field** $\vec{B}$
- When $\vec{m}$ and $\vec{B}$ are **parallel** ($\theta = 0^\circ$) the **equilibrium is a stable one**. **Any small rotation** of the coil **produces a torque** which **brings it back** to its **original position**.

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The **torque** ($\vec{\tau}=0$) **vanishes** when $\vec{m}$ is either **parallel or antiparallel** to the **magnetic field** $\vec{B}$
- When $\vec{m}$ and $\vec{B}$ are **parallel** ($\theta = 0^\circ$) the **equilibrium is a stable one**. **Any small rotation** of the coil **produces a torque** which **brings it back** to its **original position**.
- When they are **antiparallel** ($\theta = 180^\circ$), the **equilibrium is unstable**.

Torque on a Current Loop In a Uniform Magnetic Field

Case 2: When the plane of the loop, is not along the magnetic field

- The **torque** ($\vec{\tau}=0$) **vanishes** when $\vec{m}$ is either **parallel or antiparallel** to the **magnetic field** $\vec{B}$
- When $\vec{m}$ and $\vec{B}$ are **parallel** ($\theta = 0^\circ$) the **equilibrium is a stable one**. **Any small rotation** of the coil **produces a torque** which **brings it back** to its **original position**.
- When they are **antiparallel** ($\theta = 180^\circ$), the **equilibrium is unstable**.
- If the **loop has N** closely wound **turns**, the expression for **torque** is

$$\vec{\tau} = N I \vec{A} \times \vec{B}$$

Example 4.11

A **100 turn** closely wound circular coil of **radius 10 cm** carries a **current of 3.2 A**.

(a) **What is the field at the centre of the coil?**

(b) **What is the magnetic moment of this coil?**

The coil is placed in a vertical plane and is free to rotate about a horizontal axis which coincides with its diameter. A **uniform magnetic field of 2 T** in the horizontal direction exists such that **initially the axis of the coil is in the direction of the field**. The **coil rotates** through an **angle of 90°** under the influence of the magnetic field.

(c) **What are the magnitudes of the torques on the coil in the initial and final position?**

(d) **What is the angular speed** acquired by the coil when it has rotated by 90° ? The **moment of inertia** of the coil is 0.1 kg m^2 .

5. A current carrying loop is placed in a uniform magnetic field. The torque acting on it does ***not*** depend upon the :

- | | |
|----------------------|-------------------------|
| (a) magnetic field | (b) current in the loop |
| (c) area of the loop | (d) shape of the loop |

5. A current carrying loop is placed in a uniform magnetic field. The torque acting on it does ***not*** depend upon the :

- | | |
|----------------------|-------------------------|
| (a) magnetic field | (b) current in the loop |
| (c) area of the loop | (d) shape of the loop |

(d) Shape of loop

7. An electron is revolving around a nucleus in a circular orbit of radius r with a constant speed v . The magnetic moment associated with the circulating current is :

(a) $\frac{evr}{4}$

(b) $4\ evr$

(c) $2\ evr$

(d) $\frac{evr}{2}$

7. An electron is revolving around a nucleus in a circular orbit of radius r with a constant speed v . The magnetic moment associated with the circulating current is :

(a) $\frac{evr}{4}$

(b) $4\ evr$

(c) $2\ evr$

(d) $\frac{evr}{2}$

(d) $\frac{evr}{2}$

18. *Assertion (A) :* A current carrying square loop made of a wire of length L is placed in a magnetic field. It experiences a torque which is greater than the torque on a circular loop made of the same wire carrying the same current in the same magnetic field.

Reason (R) : A square loop occupies more area than a circular loop, both made of wire of the same length.

18. *Assertion (A)* : A current carrying square loop made of a wire of length L is placed in a magnetic field. It experiences a torque which is greater than the torque on a circular loop made of the same wire carrying the same current in the same magnetic field.

Reason (R) : A square loop occupies more area than a circular loop, both made of wire of the same length.

(d) Assertion (A) is false and Reason (R) is also false.

7. The ratio of the magnitude of magnetic moment to that of angular momentum, of an electron revolving around the nucleus in a hydrogen atom is :

(a) Zero

(b) $9.27 \times 10^{-24} \text{ C/kg}$

(c) $8.8 \times 10^{10} \text{ C/kg}$

(d) $6.6 \times 10^{-12} \text{ C/kg}$

7. The ratio of the magnitude of magnetic moment to that of angular momentum, of an electron revolving around the nucleus in a hydrogen atom is :

(a) Zero

(b) $9.27 \times 10^{-24} \text{ C/kg}$

(c) $8.8 \times 10^{10} \text{ C/kg}$

(d) $6.6 \times 10^{-12} \text{ C/kg}$

(c) $8.8 \times 10^{10} \text{ C/kg}$

18. *Assertion (A) :* When radius of a circular loop carrying a steady current is doubled, its magnetic moment becomes four times.

Reason (R): The magnetic moment of a circular loop carrying a steady current is proportional to the area of the loop.

18. *Assertion (A) :* When radius of a circular loop carrying a steady current is doubled, its magnetic moment becomes four times.

Reason (R): The magnetic moment of a circular loop carrying a steady current is proportional to the area of the loop.

(a) Both Assertion (A) and Reason(R) are true and Reason (R) is the correct explanation of the Assertion (A).

- 22.** A wire of length L is bent round in the form of (i) a square, and then (ii) an equilateral triangle. If current I is passed through each of them, find the ratio of magnetic moment of the square loop to that of the triangle.

For square loop; $L = 4a \Rightarrow a = \frac{L}{4}$	
Area of square loop $= \frac{L^2}{16}$	$\frac{1}{2}$
For equilateral triangle; $L = 3a \Rightarrow a = \frac{L}{3}$	
Area of equilateral triangle $= \frac{\sqrt{3}}{4} a^2$	$\frac{1}{2}$
$= \frac{\sqrt{3}}{4} \left(\frac{L^2}{9} \right) = \frac{\sqrt{3}L^2}{36}$	
Magnetic moment $\propto$ Area of the loop.	$\frac{1}{2}$
$\Rightarrow \frac{m_s}{m_t} = \frac{L^2}{16} \times \frac{36}{\sqrt{3}L^2} = \frac{3\sqrt{3}}{4}$	$\frac{1}{2}$

- 23.** Two wires of equal lengths are shaped in the form of a square loop and a circular loop. Both loops are suspended in a uniform magnetic field. Prove that for the same current, the circular loop will experience larger torque. 2

Let the length of the wire be l .

For square loop; $l = 4a \Rightarrow a = \frac{l}{4}$

Area of square loop $= a^2 = \frac{l^2}{16}$

---(i)

$\frac{1}{2}$

For Circular loop; $l = 2\pi r \Rightarrow r = \frac{l}{2\pi}$

Area of circular loop(A_c) $= \pi r^2 = \frac{l^2}{4\pi}$

----(ii)

$\frac{1}{2}$

Torque acting on the loop (τ) $\propto A$

$\frac{1}{2}$

$\therefore A_c > A_s \quad \therefore \tau_c > \tau_s$

$\frac{1}{2}$

- 19.** A wire of length l is in the form of a circular loop A of one turn. This loop is reshaped into loop B of three turns. Find the ratio of the magnetic fields at the centres of loop A and loop B for the same current through them.

$$B = \frac{\mu_o NI}{2r}$$

$$1/2$$

$$l = 2\pi r \text{ ; } 2\pi r_A = 3(2\pi r_B)$$

$$r_B = \frac{r_A}{3}$$

$$1/2$$

$$\frac{B_A}{B_B} = \frac{\mu_o N_A I}{2r_A} \times \frac{2r_B}{\mu_o N_B I}$$

$$1/2$$

$$\frac{B_A}{B_B} = \frac{1}{9}$$

$$1/2$$

18. **Assertion (A)** : The deflecting torque acting on a current carrying loop is zero when its plane is perpendicular to the direction of magnetic field.

1

Reason (R) : The deflecting torque acting on a loop of magnetic moment $\vec{m}$ in a magnetic field $\vec{B}$ is given by the dot product of $\vec{m}$ and $\vec{B}$.

18. **Assertion (A)** : The deflecting torque acting on a current carrying loop is zero when its plane is perpendicular to the direction of magnetic field.

1

Reason (R) : The deflecting torque acting on a loop of magnetic moment $\vec{m}$ in a magnetic field $\vec{B}$ is given by the dot product of $\vec{m}$ and $\vec{B}$.

(C) Assertion (A) is true and Reason (R) is false.

17. *Assertion (A) :* A planar loop of irregular shape carrying current is subjected to a magnetic field acting perpendicular to the plane of the loop. If the wire is flexible, the loop takes a circular shape.

Reason (R) : The force acting on each point of a current carrying loop, in a magnetic field perpendicular to its plane, is radially outward.

17. *Assertion (A) :* A planar loop of irregular shape carrying current is subjected to a magnetic field acting perpendicular to the plane of the loop. If the wire is flexible, the loop takes a circular shape.

Reason (R) : The force acting on each point of a current carrying loop, in a magnetic field perpendicular to its plane, is radially outward.

(a) Both Assertion (A) and Reason (R) are true, but Reason (R) is the correct explanation of the Assertion (A)

- (ii) An electron is revolving around a proton in an orbit of radius r with a speed v . Obtain expression for magnetic moment associated with the electron.

- (ii) An electron is revolving around a proton in an orbit of radius r with a speed v . Obtain expression for magnetic moment associated with the electron.

(ii) The equivalent current

$$I = \frac{q}{t} = \frac{e}{\frac{2\pi r}{v}} = \frac{ev}{2\pi r}$$

Magnetic moment of revolving electron

$$m = IA$$

$$= \frac{ev}{2\pi r} \times \pi r^2$$

$$= \frac{1}{2} evr$$

$\frac{1}{2}$

- 24.** A circular coil with cross-sectional area 0.2 cm^2 carries a current of 4 A . It is kept in a uniform magnetic field of magnitude 0.5 T normal to the plane of the coil. Calculate :
- (a) the net force on the coil.
 - (b) the torque on the coil.
 - (c) the average force on each electron in the coil due to the magnetic field. The free electron density in the material of the coil is 10^{28} m^{-3} .

Calculating		
(a)	Net force	1
(b)	Torque	1
(c)	Average force	1

(a)

Net force = zero

By symmetry, force on each element of the coil is equal and opposite to the force on the diametrically opposite element of the coil. Hence, the net force is zero.

Alternatively :

$$d\vec{f}_1 = I d\vec{l} \times \vec{B}$$

$$d\vec{f}_2 = I d\vec{l} \times \vec{B}$$

$$\vec{F}_1 = -\vec{F}_2$$

On coil magnetic force are equal and opposite, so they will cancel out each other.

(b)

Torque on the coil.

$$\vec{\tau} = \vec{m} \times \vec{B}$$

$$\tau = m B \sin \theta \quad \left[\vec{m} \parallel \vec{B} \right]$$

$$\tau = m B \sin 0^\circ \quad \theta = 0^\circ$$

$$\tau = 0$$

(B) Explanation of magnetic dipole to attain	
(i) Stable equilibrium	1
(ii) Unstable equilibrium	1

(a) (i) Right hand thumb rule When we hold a conductor in right hand in such a way that a thumb stretches in the direction of flow of current than the curled fingers shows the direction of magnetic field.	1
(ii) Magnetic field due to straight conductor at a distance r is given by Since $B \propto \frac{1}{r}$ As r increases , B decreases	1
(iii) B depends on current ,nature of medium and angle θ between current element and displacement r.(any two factors)	$\frac{1}{2} + \frac{1}{2}$
(B) Explanation (i) Stable equilibrium When the magnetic dipole aligned along the direction of external magnetic field. (ii) Unstable equilibrium When the magnetic dipole align in opposite direction of external magnetic field .	1

(B) Derive an expression for torque acting as a rectangular loop carrying a steady current when placed in a uniform magnetic field.

(B) Derivation of torque

The magnetic field exerts no force on two arms of length 'a' parallel to magnetic field.

1/2

The field exerts a force on two arm of length b perpendicular to magnetic field is,

$$F_1 = F_2 = IbB$$

1/2

F_1 is directed into the plane of the loop and F_2 is directed out of the plane of paper. Thus the net force on the loop is zero .

1/2

There is a torque on loop due to pair of force $\vec{F}_1$ and $\vec{F}_2$. The torque on the loop tends to rotate anticlockwise.

The magnitude of torque -

$$\begin{aligned}\tau &= F_1 \frac{a}{2} + F_2 \frac{a}{2} \\ &= IbB \frac{a}{2} + IbB \frac{a}{2} = I(ab)B \\ \tau &= IAB\end{aligned}$$

(C) 0.196 Am^2

(D) 0.615 Am^2

7. A current of $\left(\frac{10}{\pi}\right)$ A is maintained in a circular loop of radius 14 cm. The value of dipole moment associated with the loop is :

(A) 0.019 Am^2

(B) 0.14 Am^2

(C) 0.196 Am^2

(D) 0.615 Am^2

(C) 0.196 Am^2

26. An electron of mass m and charge $-e$ is revolving anticlockwise around the nucleus of an atom.

(a) Obtain the expression for the magnetic dipole moment (μ) of the atom.

(b) If $\vec{L}$ is the angular momentum of electron, show that

$$\vec{\mu} = - \left(\frac{e}{2m} \right) \vec{L}.$$

3

a) Obtaining expression for magnetic dipole moment	1½
b) To Show $\vec{\mu} = - \left(\frac{e}{2m} \right) \vec{L}$	1½

a) $\mu = IA$ $= \frac{e}{T} \times A$	$\frac{1}{2}$
$= \frac{e}{\frac{2\pi r}{v}} \times \pi r^2$	$\frac{1}{2}$
$= \frac{1}{2} evr$	$\frac{1}{2}$
b) $L = mvr$ $\mu = \frac{evr \times m}{2 \times m}$	$\frac{1}{2}$
$= \left(\frac{e}{2m} \right) L$	$\frac{1}{2}$
Direction of $\vec{\mu}$ is opposite to that of $\vec{L}$ $\vec{\mu} = - \left(\frac{e}{2m} \right) \vec{L}$	$\frac{1}{2}$

- (b) (i) A current carrying loop can be considered as a magnetic dipole placed along its axis. Explain.
- (ii) Obtain the relation for magnetic dipole moment $\vec{M}$ of current carrying coil. Give the direction of $\vec{M}$.
- (iii) A current carrying coil is placed in an external uniform magnetic field. The coil is free to turn in the magnetic field. What is the net force acting on the coil ? Obtain the orientation of the coil in stable equilibrium. Show that in this orientation the flux of the total field (field produced by the loop + external field) through the coil is maximum.

(i) Explanation	1
(ii) Obtaining relation for $\vec{M}$, and direction of $\vec{M}$.	1+1
(iii) Net force on coil	1
Obtaining orientation	$\frac{1}{2}$
Showing flux is maximum	$\frac{1}{2}$

(i) The two faces of a current carrying loop behave like two poles of a magnet therefore can be considered as a magnetic dipole placed along its axis.

1

(ii) Magnetic moment (M) $\propto$ Current (I)

$\propto$ Area (A)

$$\therefore \vec{M} = I\vec{A}$$

1

Direction is same as the area vector.

1

Alternatively: -

Magnetic moment is perpendicular to the plane of the coil.

(iii) Net force acting on the coil is zero.

1

The potential energy (U_B) of a current carrying loop in an external magnetic

$$\text{field} = -\vec{M} \cdot \vec{B}$$

For the coil to be in stable equilibrium U_B should be minimum so $\theta = 0^\circ$.

$\frac{1}{2}$

Therefore, magnetic flux (ϕ) due to the total field $= (B_{\text{coil}} + B_{\text{ext}})A$, which is its maximum value.

$\frac{1}{2}$

Alternatively: -

Orientation of stable equilibrium is one where the area vector A of the loop is in the direction of external magnetic field. In this orientation, the magnetic field produced by the loop is in the same direction as external field, both normal to the plane of the loop, thus giving rise to maximum flux of the total field.

33. (a) (i) A proton moving with velocity $\vec{V}$ in a non-uniform magnetic field traces a path as shown in the figure.

5

The path followed by the proton is always in the plane of the paper. What is the direction of the magnetic field in the region near points P, Q and R ? What can you say about relative magnitude of magnetic fields at these points ?

- (ii) A current carrying circular loop of area A produces a magnetic field B at its centre. Show that the magnetic moment of the loop

is $\frac{2 BA}{\mu_0} \sqrt{\frac{A}{\pi}}$.

- | | |
|---|---|
| i) Finding the direction of magnetic field near points P, Q and R | $\frac{1}{2} + \frac{1}{2} + \frac{1}{2}$ |

- (b) Consider the above mentioned coil placed in YZ plane with its centre at the origin. Derive expression for the value of magnetic field due to it at point $(x, 0, 0)$.

3

a) Writing expression for magnetic moment	$\frac{1}{2}$ mark
b) Figure	$\frac{1}{2}$ mark
Magnetic field and calculation	2 mark

(a) magnetic moment = $M = NIA$
 $M = NI\pi r^2$

According to Biot-sevart law

$$\overrightarrow{dB} = \frac{\mu_0 I}{4\pi} \frac{|\overrightarrow{dl} \times \vec{r}|}{r^3}$$

$$dB = \frac{\mu_0 I}{4\pi} \frac{dl}{r^2}$$

$dB_{\perp}$ components due to diametrically opposite components cancel out. Only dB_x components remain

$$dB_x = \frac{\mu_0 I dl}{4\pi r^2} \cdot \cos\theta$$

$$B = \int dB_x$$

$$B = \frac{\mu_0 I R^2}{2(R^2 + x^2)^{3/2}} \text{ (along } x \text{ axis)}$$

- (a) Derive the expression for the torque acting on a current carrying loop placed in a magnetic field.
- (b) Explain the significance of a radial magnetic field when a current carrying coil is kept in it.

(a) Derivation of the expression for torque	2
(b) Significance of radial magnetic field	1

Force on arm AB = $F_1 = I b B$ (directed into the plane of the loop)
 Force on arm CD = $F_2 = I b B$ (directed out of the plane of the loop)

Therefore the magnitude of the torque on the loop due to these pair of forces

$$\begin{aligned}\tau &= F_1 \frac{a}{2} + F_2 \frac{a}{2} \\ &= I (ab) B \\ &= IAB = mB \\ & \text{(} A = ab = \text{area of the loop) }\end{aligned}$$

Alternatively

Also accept if the student does calculations for the general case and obtains the result

(b) When a current carrying coil is kept in a radial magnetic field the corresponding moving coil galvanometer would have a linear scale

Alternatively " In a radial magnetic field two sides of the rectangular coil remain parallel to the magnetic field lines while its other two sides remain perpendicular to the magnetic field lines. This holds for all positions of the coil."
