31. (a) (A) Two point charges q_1 and q_2 in air are located at $\vec{r}_1$ and $\vec{r}_2$ respectively in a region of uniform external field $\vec{E}$. Obtain an expression for the electrostatic potential energy of the system.
- (B) A potential difference of 480 V is applied between two large horizontal plates, kept one above the other, 3.0 cm apart. A charged particle of mass 4×10^{-11} kg, when released at rest between the plates, remains stationary in the region. If the upper plate is at positive potential, find
- (i) nature of the charge on the particle
 - (ii) the magnitude of the charge on the particle.

5

(a) Expression for potential energy.

Work done in bringing the charge q_1 from ∞ to r_1 , $W_1 = q_1 V(\vec{r}_1)$

Work done in bringing the charge q_2 from ∞ to r_2 is not only against the external field but also against the field due to q_1

$$W_2 = q_2 V(\vec{r}_2) + \frac{q_1 q_2}{4\pi\epsilon_0 \vec{r}_{12}}$$

Where r_{12} is the distance between q_1 and q_2

Thus, potential energy of the system = total work done in assembling the system

$$U = q_1 V(\vec{r}_1) + q_2 V(\vec{r}_2) + \frac{q_1 q_2}{4\pi\epsilon_0 \vec{r}_{12}}$$

(B) (i) As charge particle at rest which implies that electrostatic force balances the gravitational force.

So, nature of charge is negative.

$$(ii) \quad mg = qE = q \frac{V}{l}$$

$$q = \frac{4 \times 10^{-11} \times 10 \times 3 \times 10^{-2}}{480}$$

$$q = 2.5 \times 10^{-14} \text{ C}$$

3. Four point charges Q each, are held at the four corners of a square of side l . The amount of work done in bringing a charge Q from infinity to the centre of the square will be :

(A) $\frac{Q^2}{\pi \epsilon_0 l}$

(B) $\frac{\sqrt{2} Q^2}{\pi \epsilon_0 l}$

(C) $\frac{Q^2}{2\pi \epsilon_0 l}$

(D) Zero

2

CBSE 23

- (i) the electrostatic potential energy of the arrangement ? and
(ii) the potential at point D ?

(i) $U = -\frac{kQq}{L} + \frac{kQq}{L} - \frac{kq^2}{L}$	$\frac{1}{2}$
$U = -\frac{kq^2}{L}$	$\frac{1}{2}$
(ii) $V = V_{DA} + V_{DB} + V_{DC}$	
$V = \frac{2KQ}{L\sqrt{3}} - \frac{2Kq}{L} + \frac{2Kq}{L}$	$\frac{1}{2}$
$V = \frac{2KQ}{L\sqrt{3}}$	$\frac{1}{2}$

33. (a) Two point charges q_1 and q_2 are kept at a distance of r_{12} in air. Deduce the expression for the electrostatic potential energy of this system.
- (b) If an external electric field (E) is applied on the system, write the expression for the total energy of this system.

CBSE 20

33. (a) Two point charges q_1 and q_2 are kept at a distance of r_{12} in air. Deduce the expression for the electrostatic potential energy of this system.
- (b) If an external electric field (E) is applied on the system, write the expression for the total energy of this system.

CBSE 20

3

(a) Work done in bringing the charge q_2 , from infinity, to a point

$= q_2 \times \text{potential at the point due to charge } q_1$

$$= q_2 \times \frac{1}{4\pi\epsilon_0} \frac{q_1}{r_{12}}$$

$$\therefore \text{potential energy of the system} = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r_{12}}$$

(b) Let the potentials, at two points, due to an external electric field (E) be V_1 and V_2 respectively.

Now the total energy of the system is:

$$\left[q_1 V_1 + q_2 V_2 + \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r_{12}} \right]$$

$\frac{1}{2}$

1

$1\frac{1}{2}$

- (a) Two point charges q_1 and q_2 are kept r distance apart in a uniform external electric field $\vec{E}$. Find the amount of work done in assembling this system of charges.
- (b) A cube of side 20 cm is kept in a region as shown in the figure. An electric field $\vec{E}$ exists in the region such that the potential at a point is given by $V = 10x + 5$, where V is in volt and x is in m.

CBSE 20

Find the

- (i) electric field $\vec{E}$, and
- (ii) total electric flux through the cube.

The work done in bringing charge q_1 from infinity to r_1 is

$$W_1 = q_1 V_1 \quad \frac{1}{2}$$

The work done in bringing charge q_2 from infinity to r_2 is

$$W_2 = q_2 V_2 \quad \frac{1}{2}$$

Work done in moving q_2 against the field due to q_1

$$W_3 = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r} \quad \frac{1}{2}$$

Hence total work done is $W = W_1 + W_2 + W_3$

$$W = q_1 V_1 + q_2 V_2 + \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r} \quad \frac{1}{2}$$

[V_1 and V_2 are potentials at the two points in the electric field]

(b)

(i)

$$E = \frac{-dV}{dx} = -\frac{d}{dx}(10x + 5) \quad 1$$

$$\therefore \vec{E} = -10\hat{i} \text{ N/C} \quad \frac{1}{2}$$

(ii) Electric flux through the cube, ϕ = sum of electric flux through 6 faces

Electric flux through faces perpendicular Y and Z axis = 0 $\frac{1}{2}$

$\because$ E is along x axis

Electric flux through faces perpendicular to x axis

$$= \phi_1 + \phi_2 \quad \frac{1}{2}$$

$$= 10 \times (0.2)^2 - 10 \times (0.2)^2$$

$$= 0 \quad \frac{1}{2}$$

An electron is accelerated through a potential difference V . Write the expression for its final speed, if it was initially at rest.

CBSE 18

Two point charges q and $-q$ are located at points $(0, 0, -a)$ and $(0, 0, a)$ respectively.

- (a) Find the electrostatic potential at $(0, 0, z)$ and $(x, y, 0)$
- (b) How much work is done in moving a small test charge from the point $(5, 0, 0)$ to $(-7, 0, 0)$ along the x -axis ?
- (c) How would your answer change if the path of the test charge between the same points is not along the x -axis but along any other random path ?
- (d) If the above point charges are now placed in the same positions in a uniform external electric field $\vec{E}$, what would be the potential energy of the charge system in its orientation of unstable equilibrium ?

Justify your answer in each case.

- (a) Explain why, for any charge configuration, the equipotential surface through a point is normal to the electric field at that point.
Draw a sketch of equipotential surfaces due to a single charge ($-q$), depicting the electric field lines due to the charge.
- (b) Obtain an expression for the work done to dissociate the system of three charges placed at the vertices of an equilateral triangle of side 'a' as shown below.

(a) If the field is not normal to an equipotential surface, it would have a non zero component along the surface. This would imply that work would have to be done to move a charge on the surface which is contradictory to the definition of equipotential surface.

1 ½

(Alternatively,

Work done to move a charge dq , on a surface, can be expressed as

$$dW = dq(\vec{E} \cdot \vec{dr})$$

But $dW=0$ on an equipotential surface

$$\therefore \vec{E} \perp \vec{dr}$$

Equipotential surfaces for a charge $-q$

11. Two points R and S are equidistant from two charges $+Q$ and $-2Q$. The work done in moving a charge $-Q$ from point R to S is :

- (A) Zero
- (B) $-\frac{Q}{4\pi\epsilon_0 d}$
- (C) $\frac{Q}{4\pi\epsilon_0 d}$
- (D) $\frac{3Q}{4\pi\epsilon_0 d}$

11. Two points R and S are equidistant from two charges $+Q$ and $-2Q$. The work done in moving a charge $-Q$ from point R to S is :

- (A) Zero
- (B) $-\frac{Q}{4\pi\epsilon_0 d}$
- (C) $\frac{Q}{4\pi\epsilon_0 d}$
- (D) $\frac{3Q}{4\pi\epsilon_0 d}$

CBSE 2026

(A) Zero

18. An electric dipole consists of two point charges $+1\ \mu\text{C}$ and $-1\ \mu\text{C}$, held 10 cm apart. It is subjected to a uniform electric field of 100 N/C. Calculate the amount of work done in turning the dipole from its position of stable equilibrium to the position of unstable equilibrium, in the field. 2

18. An electric dipole consists of two point charges $+1 \mu\text{C}$ and $-1 \mu\text{C}$, held 10 cm apart. It is subjected to a uniform electric field of 100 N/C. Calculate the amount of work done in turning the dipole from its position of stable equilibrium to the position of unstable equilibrium, in the field. 2

CBSE 2026

Work done in turning the dipole in an external field = $-pE(\cos \theta_2 - \cos \theta_1)$

$\frac{1}{2}$

Given: $\theta_1 = 0^\circ$ (stable equilibrium) and $\theta_2 = 180^\circ$ (unstable equilibrium)

$\frac{1}{2}$

Net work done in turning the dipole from its position of stable equilibrium to the position of unstable equilibrium = $2pE = 2(2qa)E$

$$= 2 \times 1 \times 10^{-6} \times 10 \times 10^{-2} \times 100$$

$\frac{1}{2}$

$$\text{Net work done} = 2 \times 10^{-5} \text{ J}$$

$\frac{1}{2}$

32. (a) (i) Explain the following statements giving reason :

- (I) An equipotential surface through a point is normal to the electric field at that point.
- (II) When a dielectric is placed in an external electric field, the electric field inside the dielectric is less than that outside it.
- (III) The potential difference between the plates of a charged parallel plate capacitor decreases when its plates are brought closer.

- (ii) Obtain an expression for the work done to dissociate the system of three charges q , $-4q$ and $2q$ placed at the vertices A, B and C respectively of an equilateral triangle of side 'a'.

5

(i)

(I) If the field were not normal to the equipotential surface, it would have non-zero component along the surface. To move a unit test charge against the direction of the component of the field, work would be done. This is in contradiction to the definition of equipotential surface.

Alternatively

$$\oint \vec{E} \cdot d\vec{l} = V_A - V_B; V_A = V_B \text{ for equipotential surface}$$

$$\oint \vec{E} \cdot d\vec{l} = 0 \Rightarrow \cos \theta = 0 \text{ as } E \neq 0 \text{ \& } dl \neq 0 \text{ and } \theta = 90^\circ$$

(II) When a dielectric is placed in an external electric field, due to polarization of its molecules, an electric field is induced in a direction opposite to the external field, hence net electric field inside is reduced.

Note: Full credit to be given if explained diagrammatically.

Alternatively

$$\varepsilon = \varepsilon_0 - \varepsilon_p$$

(III) Potential difference (V) = $\frac{Q}{C}$

$$V = \frac{Qd}{A\varepsilon_0}$$

$$V \propto d$$
